

3.2 BINARY SEARCH TREES

- ▶ *BSTs*
- ▶ *ordered operations*
- ▶ *deletion*

Binary search trees

Definition. A BST is a **binary tree** in **symmetric order**.

A binary tree is either:

- Empty.
- Two disjoint binary trees (left and right).

Symmetric order. Each node has a key, and every node's key is:

- Larger than all keys in its left subtree.
- Smaller than all keys in its right subtree.

BST representation in Java

Java definition. A BST is a reference to a root Node.

A Node is comprised of four fields:

- A Key and a Value.
- A reference to the left and right subtree.

↑ smaller keys ↑ larger keys

```
private class Node
{
    private Key key;
    private Value val;
    private Node left, right;
    public Node(Key key, Value val)
    {
        this.key = key;
        this.val = val;
    }
}
```

Key and Value are generic types; Key is Comparable

BST implementation (skeleton)

```
public class BST<Key extends Comparable<Key>, Value>  
{
```

```
    private Node root;
```

← root of BST

```
    private class Node  
    { /* see previous slide */ }
```

```
    public void put(Key key, Value val)  
    { /* see next slides */ }
```

```
    public Value get(Key key)  
    { /* see next slides */ }
```

```
    public void delete(Key key)  
    { /* see next slides */ }
```

```
    public Iterable<Key> iterator()  
    { /* see next slides */ }
```

```
}
```

Binary search tree demo

Search. If less, go left; if greater, go right; if equal, search hit.

successful search for H

Binary search tree demo

Insert. If less, go left; if greater, go right; if null, insert.

insert G

BST search: Java implementation

Get. Return value corresponding to given key, or null if no such key.

```
public Value get(Key key)
{
    Node x = root;
    while (x != null)
    {
        int cmp = key.compareTo(x.key);
        if      (cmp < 0) x = x.left;
        else if (cmp > 0) x = x.right;
        else if (cmp == 0) return x.val;
    }
    return null;
}
```

Cost. Number of compares is equal to 1 + depth of node.

BST insert

Put. Associate value with key.

Search for key, then two cases:

- Key in tree \Rightarrow reset value.
- Key not in tree \Rightarrow add new node.

inserting L

Insertion into a BST

BST insert: Java implementation

Put. Associate value with key.

```
public void put(Key key, Value val)
{ root = put(root, key, val); }

private Node put(Node x, Key key, Value val)
{
    if (x == null) return new Node(key, val);
    int cmp = key.compareTo(x.key);
    if (cmp < 0)
        x.left = put(x.left, key, val);
    else if (cmp > 0)
        x.right = put(x.right, key, val);
    else if (cmp == 0)
        x.val = val;
    return x;
}
```

concise, but tricky,
recursive code;
read carefully!

Cost. Number of compares is equal to $1 + \text{depth of node}$.

Tree shape

- Many BSTs correspond to same set of keys.
- Number of compares for search/insert is equal to $1 + \text{depth of node}$.

best case

typical case

worst case

Remark. Tree shape depends on order of insertion.

BST insertion: random order visualization

Ex. Insert keys in random order.

Correspondence between BSTs and quicksort partitioning

0	1	2	3	4	5	6	7	8	9	10	11	12	13
P	S	E	U	D	O	M	Y	T	H	I	C	A	L
P	S	E	U	D	O	M	Y	T	H	I	C	A	L
H	L	E	A	D	O	M	C	I	P	T	Y	U	S
D	C	E	A	H	O	M	L	I	P	T	Y	U	S
A	C	D	E	H	O	M	L	I	P	T	Y	U	S
A	C	D	E	H	O	M	L	I	P	T	Y	U	S
A	C	D	E	H	O	M	L	I	P	T	Y	U	S
A	C	D	E	H	O	M	L	I	P	T	Y	U	S
A	C	D	E	H	I	M	L	O	P	T	Y	U	S
A	C	D	E	H	I	M	L	O	P	T	Y	U	S
A	C	D	E	H	I	L	M	O	P	T	Y	U	S
A	C	D	E	H	I	L	M	O	P	S	T	U	Y
A	C	D	E	H	I	L	M	O	P	S	T	U	Y
A	C	D	E	H	I	L	M	O	P	S	T	U	Y
A	C	D	E	H	I	L	M	O	P	S	T	U	Y

Remark. Correspondence is 1-1 if array has no duplicate keys.

BSTs: mathematical analysis

Proposition. If N distinct keys are inserted into a BST in **random** order, the expected number of compares for a search/insert is $\sim 2 \ln N$.

Pf. 1-1 correspondence with quicksort partitioning.

Proposition. [Reed, 2003] If N distinct keys are inserted in random order, expected height of tree is $\sim 4.311 \ln N$.

How Tall is a Tree?

Bruce Reed
CNRS, Paris, France
reed@moka.ccr.jussieu.fr

ABSTRACT

Let H_n be the height of a random binary search tree on n nodes. We show that there exists constants $\alpha = 4.31107\dots$ and $\beta = 1.95\dots$ such that $\mathbf{E}(H_n) = \alpha \log n - \beta \log \log n + O(1)$. We also show that $\text{Var}(H_n) = O(1)$.

But... Worst-case height is N .

(exponentially small chance when keys are inserted in random order)

ST implementations: summary

implementation	guarantee		average case		ordered ops?	operations on keys
	search	insert	search hit	insert		
sequential search (unordered list)	N	N	N/2	N	no	equals()
binary search (ordered array)	lg N	N	lg N	N/2	yes	compareTo()
BST	N	N	1.39 lg N	1.39 lg N	next	compareTo()

3.2 BINARY SEARCH TREES

- ▶ *BSTs*
- ▶ *ordered operations*
- ▶ *deletion*

Minimum and maximum

Minimum. Smallest key in table.

Maximum. Largest key in table.

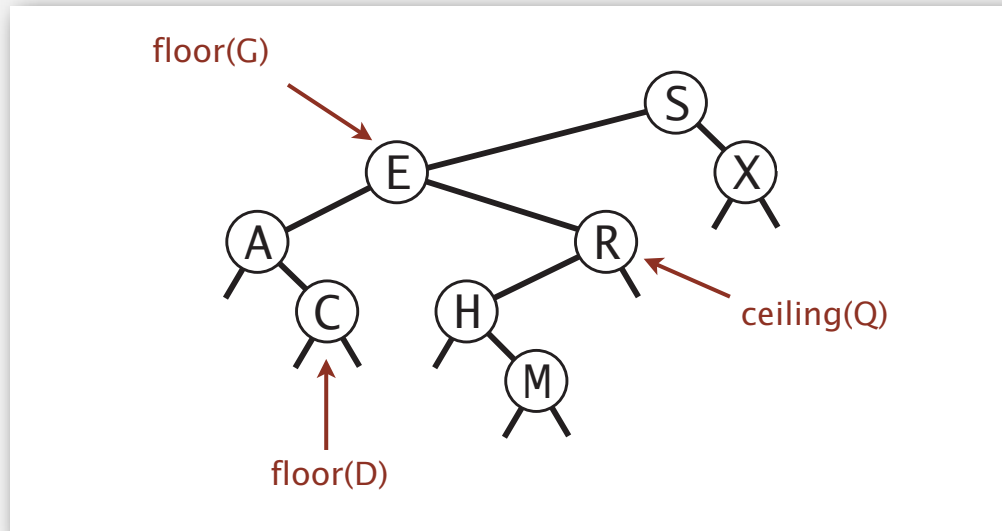

Q. How to find the min / max?

Floor and ceiling

Floor. Largest key \leq a given key.

Ceiling. Smallest key \geq a given key.

Q. How to find the floor / ceiling?

Computing the floor

Case 1. [k equals the key at root]

The floor of k is k .

Case 2. [k is less than the key at root]

The floor of k is in the left subtree.

Case 3. [k is greater than the key at root]

The floor of k is in the right subtree
(if there is any key $\leq k$ in right subtree);
otherwise it is the key in the root.

finding floor(G)

Computing the floor

```
public Key floor(Key key)
{
    Node x = floor(root, key);
    if (x == null) return null;
    return x.key;
}
private Node floor(Node x, Key key)
{
    if (x == null) return null;
    int cmp = key.compareTo(x.key);

    if (cmp == 0) return x;

    if (cmp < 0) return floor(x.left, key);

    Node t = floor(x.right, key);
    if (t != null) return t;
    else return x;
}
```

finding floor(G)

Subtree counts

In each node, we store the number of nodes in the subtree rooted at that node; to implement `size()`, return the count at the root.

Remark. This facilitates efficient implementation of `rank()` and `select()`.

BST implementation: subtree counts

```
private class Node
{
    private Key key;
    private Value val;
    private Node left;
    private Node right;
    private int count;
}
```

number of nodes in subtree

```
public int size()
{ return size(root); }
```

```
private int size(Node x)
{
    if (x == null) return 0;
    return x.count;
}
```

ok to call
when x is null

```
private Node put(Node x, Key key, Value val)
{
    if (x == null) return new Node(key, val, 1);
    int cmp = key.compareTo(x.key);
    if (cmp < 0) x.left = put(x.left, key, val);
    else if (cmp > 0) x.right = put(x.right, key, val);
    else if (cmp == 0) x.val = val;
    x.count = 1 + size(x.left) + size(x.right);
    return x;
}
```

Rank

Rank. How many keys $< k$?

Easy recursive algorithm (3 cases!)

```
public int rank(Key key)
{ return rank(key, root); }

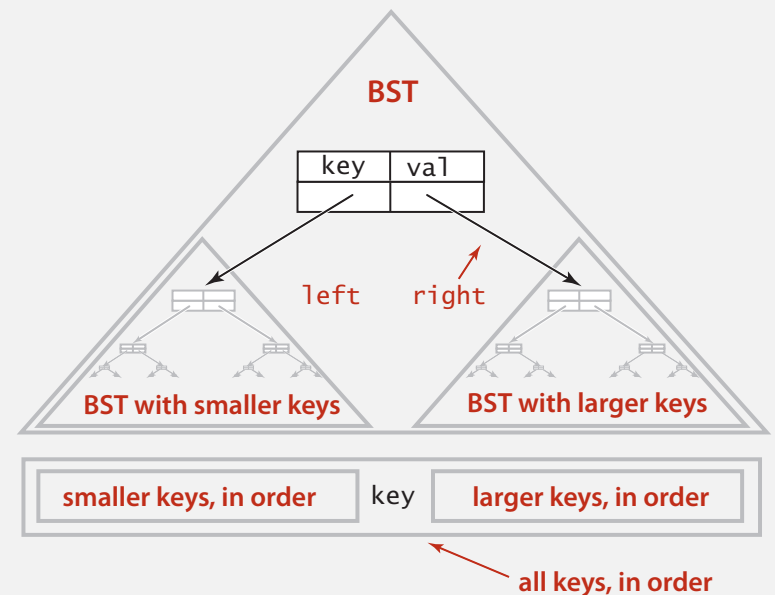

private int rank(Key key, Node x)
{
    if (x == null) return 0;
    int cmp = key.compareTo(x.key);
    if (cmp < 0) return rank(key, x.left);
    else if (cmp > 0) return 1 + size(x.left) + rank(key, x.right);
    else if (cmp == 0) return size(x.left);
}
```

Inorder traversal

- Traverse left subtree.
- Enqueue key.
- Traverse right subtree.

```
public Iterable<Key> keys()
{
    Queue<Key> q = new Queue<Key>();
    inorder(root, q);
    return q;
}

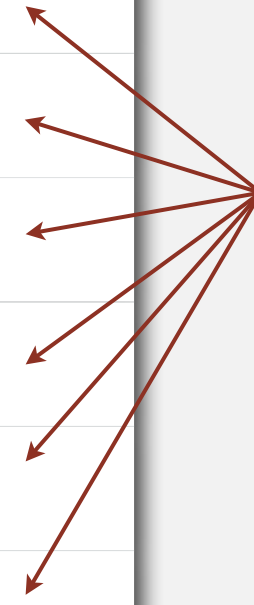

private void inorder(Node x, Queue<Key> q)
{
    if (x == null) return;
    inorder(x.left, q);
    q.enqueue(x.key);
    inorder(x.right, q);
}
```

Property. Inorder traversal of a BST yields keys in ascending order.

BST: ordered symbol table operations summary

	sequential search	binary search	BST
search	N	$\lg N$	h
insert	N	N	h
min / max	N	1	h
floor / ceiling	N	$\lg N$	h
rank	N	$\lg N$	h
select	N	1	h
ordered iteration	$N \log N$	N	N

h = height of BST
(proportional to $\log N$
if keys inserted in random order)

order of growth of running time of ordered symbol table operations
